Tool-changer system for presses  
and punching installations meets specific requirements

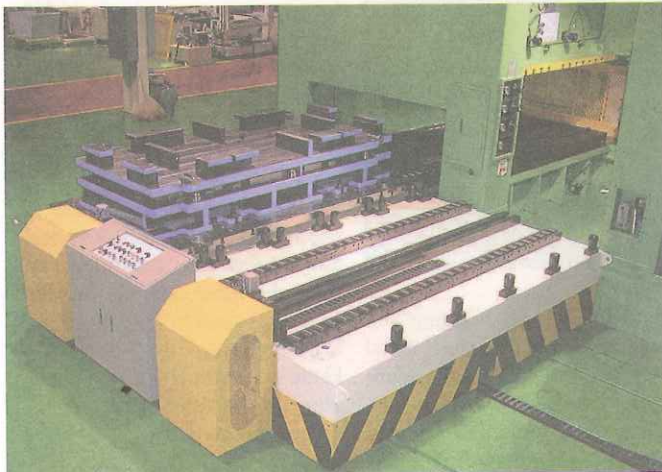

At Euroblech 2010, EAS Europe B.V. will present a comprehensively extended product programme for fast tool changing on forming presses. It is specially designed for the operating conditions on presses and punching machines for metal processing and was developed on the basis of EAS' many years of experience with similar equipment for the plastic injection moulding industry. EASchangesystems – that is the full version of the firm's name – is thus a system supplier that can offer a one-stop source of all compo-

nents for both these sectors of industry. In order to be able to provide perfectly for operating conditions on presses and punching machines, the EASchangesystems available range of hydraulic and magnetic clamping devices has been expanded again. As a new product, EAS presents the combination of roller-conveyor lifting-bar and clamping-system with the product name Esch, for simple tool insertion from the side. The special advantage of the new Esch systems is that they can be push-fitted into the standard T grooves of the press

plates, so no further modifications to the machine are necessary. They are therefore ideal for upgrading existing machines.

EAS now offers in total a complete programme of roller lifting bars with which all such needs can be met. For lesser lifting loads, versions with spring-operated rollers are available. As an alternative, there are lifting bars with integrated compressed air lifting bars. For medium to heavy loads, EAS offer heavy-load roller conveyors, which can be raised using hydraulic cylinders.

The EASchangesystems range encompasses not only equipment for introducing and clamping tools in the press, but also complete solutions for firm-internal press tool logistics – covering indeed the complete range from manual tool insertion via roller-conveyor systems and heavy-load stackers in adapted special versions to fully automatic transport and changer systems (photo). With its many years of specialisation in production automation, EAS provide system competence to create the most efficient solution in each individual joint project. dk

EAS develops and supplies, amongst other products, complete tool-changer systems at various levels of automation.
